Dynamic
memory

Allocation

Deallocation

Recap

- Variables are pieces of information stored in a computers memory.
- Don't care where in the memory.
- Just care that we can use the variables.
- Pointers store memory locations.
 - Find where variables are stored.
 - Move through memory.
- In Python almost everything is a pointer.
 - So we don't notice.
- In C++ pointers are explicitly stated.

- Variables are stored in memory (RAM).

```
char myVariable = 'Q';
```

Address	Value
1242	'Q'

- OS picks an unused memory location e.g. 1242
 - This location must have enough space to store the variable.
 - Different variable types have different sizes.
 - I.e. `sizeof(int) == 4` bytes, `sizeof(double) == 8` bytes.
 - But depends on OS, compiler, 32 or 64 bit etc.
- `myVariable` is our name for memory location 1242.
- In Python can get memory location info using `id(myVariable)` function.

Arrays and Memory

Dynamic memory

Allocation

Deallocation

Recap

- Variables are stored in memory.
- Arrays are groups of variables called elements.
- Array elements stored sequentially in contiguous blocks of memory.
 - Large objects, i.e. arrays, class instances, floats may span multiple blocks.
- Demonstrating using old C-style arrays.

```
char myArray[] = "Hello";
```

Address	Value
4213	'H'
4214	'e'
4215	'l'
4216	'l'
4217	'o'
4218	'\0'

- Variables are blocks of memory that hold data.
- Pointers are variables that hold memory addresses.
- Each type of variable has an associated pointer type.
- We declare a pointer using an * after the type name.

```
typename * variableName;  
int * i;  
char * c;  
float * f;
```

- Pointers "point to" other variables.

- Referencing is when we store a memory address in a pointer.
- The pointer is now said to be pointing at that memory address.
- Is achieved using the & operator.
- & means the memory address of.

```
char myVariable = 'Q';
```

Name	Address	Value
char myVariable;	4213	'Q'
	4214	
	4215	
	4216

Recap

- Referencing is when we store a memory address in a pointer.
- The pointer is now said to be pointing at that memory address.
- Is achieved using the & operator.
- & means the memory address of.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;
```

Name	Address	Value
char myVariable;	4213	'Q'
	4214	
	4215	
char *myPointer;	4216	

- The opposite of referencing is dereferencing.
- A pointer stores a memory address.
- Dereferencing means getting the value that is stored in that memory address.

```
char myVariable = 'Q';
```

Name	Address	Value
char myVariable;	4213	'Q'
	...	
	5617	
	...	
	7584	

- The opposite of referencing is dereferencing.
- A pointer stores a memory address.
- Dereferencing means getting the value that is stored in that memory address.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;
```

Name	Address	Value
char myVariable;	4213	'Q'
	...	
	5617	
	...	
	7584	

- The opposite of referencing is dereferencing.
- A pointer stores a memory address.
- Dereferencing means getting the value that is stored in that memory address.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;
```

Name	Address	Value
char myVariable;	4213	'Q' 4213
	...	
char *myPointer;	5617	
	...	
	7584	

- The opposite of referencing is dereferencing.
- A pointer stores a memory address.
- Dereferencing means getting the value that is stored in that memory address.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;  
char myOther = *myPointer;
```

Name	Address	Value
char myVariable;	4213	'Q'
	...	
char *myPointer;	5617	
	...	
	7584	

- The opposite of referencing is dereferencing.
- A pointer stores a memory address.
- Dereferencing means getting the value that is stored in that memory address.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;  
char myOther = *myPointer;
```

Name	Address	Value
char myVariable;	4213	4213
	...	
char *myPointer;	5617	
	...	
char myOther;	7584	'Q'

- Already seen that we can get the value of a variable via a dereferenced pointer.
- Can also set the value of a variable through a pointer.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;
```

Name	Address	Value
char myVariable;	4213	'Q'
	...	
char *myPointer;	5617	4213

- Already seen that we can get the value of a variable via a dereferenced pointer.
- Can also set the value of a variable through a pointer.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;  
myVariable = 'A';
```

Name	Address	Value
char myVariable;	4213	'A'
	...	
char *myPointer;	5617	4213

- Already seen that we can get the value of a variable via a dereferenced pointer.
- Can also set the value of a variable through a pointer.

```
char myVariable = 'Q';  
char *myPointer = &myVariable;  
myVariable = 'A';  
*myPointer = 'Z';
```

Name	Address	Value
char myVariable;	4213	'Z'
	...	
char *myPointer;	5617	4213

Recap

- Have seen how to change variables pointed to by a pointer.
- Pointers are also variables.
- Can change the values of pointers.
 - Can change where they are pointing.

```
array<int,4> myArray = {{69, 42, 99, 3}};
```

```
int *myPointer = myArray->data();
```

```
cout << *myPointer << endl;
```

```
myPointer += 1;
```

```
cout << *myPointer << endl;
```

```
myPointer += 2;
```

```
cout << *myPointer << endl;
```

Deallocation

Recap

- Pointers that don't point to anything are called null pointers.
- Dereferencing a null pointer will cause your program to crash.
- You can set a pointer to point to null.
 - `int *myPointer = NULL;`
 - New in C++11, but the old way works too.
`int *myPointer = nullptr;`

Allocation

Deallocation

Recap

- C++ also has reference datatypes.
- Safer than pointers.
 - Less powerful.
- Declared like pointers but with `&` instead of `*`.

```
int myVariable = 42;
```

```
int &refA = myVariable;
```

```
int &refB = refA;
```

```
int &refC; // will not work
```

Differences to pointers.

- Can't be null.
- Can't be changed to point at different locations.
- References automatically redirects to the variable.
 - Automatic dereferencing.
- Have to be initialised on creation.
 - References point at a variable the instant they are created.

Differences to pointers.

Recap

Simple Python function that doubles all the values given to it.

```
def some_function( values ):  
    for i in range(len(values)):  
        values[i] *= 2  
  
def main():  
    v = range(5)  
    print(v)          % [0, 1, 2, 3, 4]  
  
    double(v)  
    print{v)          % [0, 2, 4, 6, 8]
```

Same program in C++.

```
void some_function( int values[5] )
{
    for( int i=0; i<5; ++i )
        values[i] *= 2;
}

int main()
{
    int v[5] = {0, 1, 2, 3, 4};

    for( int i=0; i<5; ++i )           // 0, 1, 2, 3, 4
        cout << v[i] << " ";
    cout << endl;

    some_function(v);

    for( int i=0; i<5; ++i )           // 0, 1, 2, 3, 4
        cout << v[i] << " ";
    cout << endl;
}
```

The C++ program didn't work, why?

The C++ program didn't work, why?

- In Python everything is an 'alias'.
 - Variables are aliases for a memory location.
 - Aliases are similar to pointers/references.

The C++ program didn't work, why?

- In Python everything is an 'alias'.
 - Variables are aliases for a memory location.
 - Aliases are similar to pointers/references.
- When Python variable passed to a function, just passing alias to memory location.

The C++ program didn't work, why?

- In Python everything is an 'alias'.
 - Variables are aliases for a memory location.
 - Aliases are similar to pointers/references.
- When Python variable passed to a function, just passing alias to memory location.
- Changing value/s in function changes original variable/s too.

The C++ program didn't work, why?

- In Python everything is an 'alias'.
 - Variables are aliases for a memory location.
 - Aliases are similar to pointers/references.
- When Python variable passed to a function, just passing alias to memory location.
- Changing value/s in function changes original variable/s too.
- When C++ variable passed to a function, creates a new variable.
 - New variable stored in a new memory location.

The C++ program didn't work, why?

- In Python everything is an 'alias'.
 - Variables are aliases for a memory location.
 - Aliases are similar to pointers/references.
- When Python variable passed to a function, just passing alias to memory location.
- Changing value/s in function changes original variable/s too.
- When C++ variable passed to a function, creates a new variable.
 - New variable stored in a new memory location.
- Changing value/s in function doesn't change original variable/s.

Why use pointers/references?

Advantages.

- Pointers/references are small.
 - Instead of copying big data structures around just copy the pointer.
 - E.g. an array storing a picture == millions of bytes.
 - Pointer/reference to an array storing a picture == 4-8 bytes.
- Pointers are required for dynamic memory allocation (C++).

Disadvantages.

- Pointers are dangerous.
 - Buggy pointer code can crash your program/computer.

How to dynamically allocate arrays?

```
int staticArray[10]; // works  
int* dynamicArray = new int[10]; // works
```

```
int size;  
cout << "How big an array do you want?" << endl;  
cin >> size;  
  
int staticArray[size]; // won't compile  
int* dynamicArray = new int[size]; // works
```

Dynamic memory deallocation

- You **MUST** remember to deallocate your memory.
- Failure to do so causes a memory leak.
 - Memory gradually gets 'lost'.

```
int* myVariable = new int;  
int* myArray = new int[1000];  
  
// do stuff  
  
delete myVariable;  
delete [] myArray;
```

Dynamic memory deallocation

- You **MUST** remember to deallocate your memory.
- Failure to do so causes a memory leak.
 - Memory gradually gets 'lost'.
- No exceptions.

```
int* myVariable = new int;  
int* myArray = new int[1000];  
  
// do stuff  
  
delete myVariable;  
delete [] myArray;
```

```

- Python does memory allocation and deallocation for you automatically.
 - Automatically allocates memory as you create variables.
 - Automatically deallocates memory that isn't in use.
 - Garbage collection.
- Can still manually deallocate Python objects.

```
variable = 42

// do stuff

del(variable)
```

Recap

C++ does not have automatic garbage collection.

- C++11 comes close.
- New features - `shared_ptr` and `unique_ptr`, `weak_ptr`.
- Special new smart pointers.
 - Automatically deallocate memory when nothing pointing at it.
 - Don't need to remember to `delete`.
 - No memory leaks!
- `shared_ptr` is 99.9% the same as 'normal' pointers.
- `unique_ptr` and `weak_ptr` have extra features.

`shared_ptr<>`

STRONGLY recommend you use `shared_ptr`.
