- 1 Stack and Heap
  - Stack
  - Heap

Stack and Heap Stack

- Memory model used so far is a simplification.
- Actually two places in memory that variables can go.
  - The stack and the heap.
- Both are just regions of the same physical memory.
  - Are managed differently.

## The stack

Stack and Heap Stack

- When program is run, block of memory is allocated.
  - Called the stack.
- Each program has it's own stack.
  - Each instance.
- As variables created and functions called they are put on the stack.
- When variables are destroyed/functions complete they are removed from the stack.
- Has limited size.
  - Recursive functions can fill the stack if not careful.

```
Coventry
University
```

```
int add( int a, int b)
  int result = a+b;
  return result;
int sub( int a, int b )
  int result = a-b;
  return result;
int main()
  int var1 = 42;
  int var2 = 1;
  add(a,b);
                             Stack
                                         Heap
  sub(a,b);
  return 0;
```

```

Stack and Heap Stack

- Shared memory between all running programs.
- Very big in comparison to the stack.
- Dangerous, must remember to deallocate our memory.
  - Memory leaks.

```
int main()
  int variable = 42;
  int *pointer1;
  pointer1 = new int[6];
  int *pointer2;
  pointer2 = new int[3];
  delete [] pointer1;
  return 0;
                               Stack
                                                Heap
```

```
int main()
                           int main()
  int variable = 42;
  int *pointer1;
  pointer1 = new int[6];
  int *pointer2;
  pointer2 = new int[3];
  delete [] pointer1;
  return 0;
                                Stack
                                                Heap
```

```
int main()
    int main()
                                 int variable
       int variable = 42;
\Rightarrow
       int *pointer1;
      pointer1 = new int[6];
       int *pointer2;
      pointer2 = new int[3];
      delete [] pointer1;
      return 0;
                                      Stack
                                                       Heap
```

```
int main()
{
    int wariable
```

```
int variable = 42;
       int *pointer1;
\Rightarrow
       pointer1 = new int[6];
       int *pointer2;
       pointer2 = new int[3];
       delete [] pointer1;
       return 0;
```

```
int *pointer1
```

† † † Stack Heap

```
int main()
    int main()
                                 int variable
       int variable = 42;
                                 int *pointer1
       int *pointer1;
      pointer1 = new int[6];
\Rightarrow
       int *pointer2;
      pointer2 = new int[3];
      delete [] pointer1;
      return 0;
                                      Stack
                                                       Heap
```

```
int main()
{
   int variable = 42;
   int *pointer1;

                                 int variable
       int variable = 42;
                                 int *pointer1
                                 int *pointer2
       int *pointer1;
      pointer1 = new int[6];
      int *pointer2;
\Rightarrow
      pointer2 = new int[3];
      delete [] pointer1;
      return 0;
                                      Stack
                                                      Heap
```

```
int main()
int main()
                           int variable
  int variable = 42;
                           int *pointer1
                           int *pointer2
  int *pointer1;
  pointer1 = new int[6];
  int *pointer2;
  pointer2 = new int[3];
  delete [] pointer1;
  return 0;
```

Stack

Heap

```
int main()
  int variable = 42;
  int *pointer1;
  pointer1 = new int[6];
  int *pointer2;
  pointer2 = new int[3];
  delete [] pointer1;
  return 0;
```

```
int main()
int variable
int *pointer1
int *pointer2
    Stack
                    Heap
```

```
int main()
    int main()
                                   int variable
       int variable = 42;
                                   int *pointer1
                                                    \rightarrow
                                   int *pointer2
       int *pointer1;
       pointer1 = new int[6];
       int *pointer2;
       pointer2 = new int[3];
       delete [] pointer1;
\Rightarrow
       return 0;
                                       Stack
                                                         Heap
```

```
int main()
    int main()
                                   int variable
       int variable = 42;
                                   int *pointer1
                                                    \rightarrow
                                   int *pointer2
       int *pointer1;
       pointer1 = new int[6];
       int *pointer2;
       pointer2 = new int[3];
       delete [] pointer1;
       return 0;
\Rightarrow
                                       Stack
                                                         Heap
```

```
int main()
  int variable = 42;
  int *pointer1;
  pointer1 = new int[6];
  int *pointer2;
  pointer2 = new int[3];
  delete [] pointer1;
  return 0;
                               Stack
                                                Heap
```

#### Stack

- Fast processors typically have special instructions for dealing with stacks quickly.
- Contiguous everything in one block, easier to know where to put next variable/function.
- Small limited size.
  - Trying too variables will fill stack and cause "stack overflow".

### Heap

- Huge relative to the stack.
- Dangerous must remember to deallocate otherwise have memory leaks.
