- 4 Recap

Highs and lows

- Programming languages split into levels.
- Low level languages are machine code, assembly language.
- High level languages are Python, C++, Java etc.

| | | Forth, Basic | |
| \Downarrow | Low level | Assembly | 2 nd generation |
| | | Machine code | 1 st generation |
| | | Hardware | |

David Croft Languages

Machine code

- 1st generation.
- Really hard to understand.
- Really hard to write.
- The actual instructions to the hardware.

Assembly

- 2nd generation.
- Hard for humans to understand.
- Hard for humans to write.
- 1-to-1 correspondence with what is run.

Python, C, C++, Java, PHP, Perl etc.

- 3rd generation.
- Favour programmer, not machine.
- Easy for humans to understand...compared to the alternatives.
- Easy for humans to write...compared to the alternatives.
- Portable.
 - Different machine == different compiler.
 - Same C/Python/C++/Java code.

History of C++

So far you have used Python. Now going to learn C++.

- Created somewhere in 1979-1983.
- Based on C (created 1972).
- Going to be learning C++11 (approved 2011).
- C++14 has been approved (2014).
 - No support yet.
- 99.9% backwards compatible.
 - All the way to C.

Coventry University

Expectations

- All students are expected to learn some C++.
- In future weeks we will be looking at generic programming concepts.
 - Sorting.
 - Searching.
 - Data structures.
- Those weeks will be taught in Python and C++.
 - Everyone else will have some mandatory C++ tasks.
 - BIT students can choose Python or C++ most tasks.
 - Will be specified at the time.
- BIT will not be examined on C++ code.
 - May be examined on language differences.
 - High/low languages.
 - Compiling.
 - Static/dynamic typing.
 - Stack/heap memory.

Languages

Syntax
Conditiona
Arrays
Loops
while
for
Compiling

Most significant difference...

- C++ is statically typed.
 - Python is dynamically typed.
- In Python variables keep track of values AND type.

- In C++ variables have one type forever.
 - Have to specify type when creating.

```
int var1 = 42;
string var2 = "foo";
float var3 = 0.123;
```

In C++ have to specify a variable's type.

- So what types are available?
- Thousands (at least).
 - You can create your own.
- Few standard ones.
- Most basic data types are called primitive types.

Primitive types

Languages

Syntax Condition Arrays Loops while for Compiling

| Туре | Bytes | Values |
|--------------|-------|--------------------------|
| bool | 1 | true/false |
| char | 1 | 'a', 'Z', '6', '+' |
| int | 4 | -2147483647 → 2147483647 |
| unsigned int | 4 | o → 4294967295 |
| float | 4 | 1.234, -0.0001 |
| double | 8 | 1.23456789, -0.000000001 |
| void | | |

Sizes are correct for a 32bit machine.

Compiling

Moving from Python to C++.

- Not as bad/scary as it seems.
- Same basic structure.
- Slightly different syntax.

Hello World!

David Croft

CTT

Syntax

Arrays Loops while for Compiling Python.

```
import sys

def main():
    print('Hello World!')

if __name___ == '__main__':
    sys.exit(main())
```

C++.

```
#include <iostream>
using namespace std;

int main()
{
   cout << "Hello World!" << endl;
   return 0;
}</pre>
```

if statements

Same rules as Python.

- Slightly different syntax.
- and is now &&.
- or is now ||.
- == is still ==.

```
a = 1
b = 2
if a == b and b > 0:
    print('Hello World )
```

```
int a = 1;
int b = 2;
if( a == b \&\& b > 0)
    cout << "Hello World!" << endl;</pre>
```

Similar to Python lists.

Can't be resized.

```
sequence = [1, 2, 42, 69, 8]
sum = 0

for i in range(len(sequence)):
    sum += sequence[i]
```

```
int sequence[5] = {1, 2, 42, 69, 8};
int sum = 0;

for( int i=0; i<5; i+=1 )
{
    sum += sequence[i];
}</pre>
```

Languages C++

Condition
Arrays
Loops
while
for
Compiling

Three ways to create a C array.

Just supply size

```
int arrayOfInt[3];
char arrayOfChars[5];
float arrayOfFloats[2];
```

Supply size and initialisation list

```
int arrayOfInt[3] = { 42, 69, 12 };
char arrayOfChars[5] = { 'A', 'z', '9' };
float arrayOfFloats[2] = { 1.23, 0.001, 8.1 };
```

3 Just initialisation list (will figure out the size)

```
int arrayOfInt[] = { 42, 69, 12 };
char arrayOfChars[] = { 'A', 'z', '9' };
float arrayOfFloats[] = { 1.23, 0.001, 8.1 };
```

New and improved!

So far looked at the old style arrays.

- Carried forward from C.
- Still used today.
- C++o3 introduced an alternative.
 - STL arrays.

```
#include <array>
using namespace std;
int main()
{
    int oldArray[5] = \{1,2,3,4,5\};
    array < int, 5 > newArray = \{1, 2, 3, 4, 5\};
    cout << oldArray[0] << " " << newArray[0] << endl;</pre>
    return 0;
```

There's two of them?

Two types of arrays.

- Old style arrays are still very common.
 - Legacy.
 - Want you to start off using the new ones.
- What was wrong with the old ones?
- New arrays are safer.
 - Avoid overflows.
- Easier to use.
 - Sorting, searching, reversing, iterating etc.
- Are backwards compatible with old code.

Conditional
Arrays
Loops
while
for
Compiling

Problem, C++ arrays have a set size.

 Saw we had to provide a size when declaring arrays.

C++ does have 'arrays' that can be resized.

- Called vectors.
- Uses arrays inside.

```
#include <array>
#include <vector>
#include <iostream>
using namespace std;
int main()
{
    array < int, 5 > myArray = \{1, 2, 3, 4, 5\};
    vector<int> myVector = {1,2,3,4};
    myVector.push_back(5);
    cout << myArray[0] << endl;</pre>
    cout << myVector[0] << endl;</pre>
```

Compiling

C++ vectors are the closest thing to Python lists.

- If you are moving to C++ from Python easier to use vectors?
- lacksquare append() ightarrow push_back() and emplace_back()
- lacksquare pop() ightarrow pop_back()
- \blacksquare slicing \rightarrow resize()

Syntax
Condition
Arrays
Loops
while
for
Compiling

Same rules as Python.

- Slightly different syntax.
- Brackets ().
- Braces {}.
- Semicolons;.

```
counter = 0
while counter < 10:
    print('Hello World!')
    counter += 1</pre>
```

```
int counter = 0;
while( counter < 10 )
{
    cout << "Hello World!" << endl;
    counter += 1;
}</pre>
```

Language: C++

Syntax Condition Arrays Loops while for

Compiling

C++ has two kinds of for loops.

- One type similar to Python for loops.
 - Actually a range-based loop.
 - Will be covered later.
- One type similar to a while loop.

The original C++ for loop.

- Seems very different to the python loop.
- Lots of commonalities.
- Also to while loops.

```
for counter in range(10):
    print('Hello World!')
```

```
print('Hello World!')

for( int counter=0; counter<10; counter+=1 )
{
   cout << "Hello World!" << endl;
}</pre>
```

```
int counter = 0;
while( counter < 10 )
{
    cout << "Hello World!" << endl;
    counter += 1;
}</pre>
```

for counter in range (0,10,1):

Loops
while
for
Compiling

Ranged for loops

The new C++11 ranged for loop, for iterating over a sequence.

- Less powerful that the old style.
- Easier.
- while > for > ranged for

```
sequence = [1,2,3,4,5]
for i in sequence:
    print( i )
```

```
int main()
    array<int,5> sequence =
        { 1, 2, 3, 4, 5 };
    for( int i : sequence )
        cout << i << endl;</pre>
    return 0;
```

Languages

Arrays
Loops
while
for
Compiling

C++ code has to be compiled before it is run.

- So does Python it just happens automatically.
- Compiler converts C++ code into machine code.
- Many IDEs handle compiling for you.
 - Visual Studio, Eclipse etc.

кесар

GNU C Compiler (created 1987).

Linux, Mac and Windows.

How to compile using g++.

- Demo
- g++ -std=c++11 hello.cpp -o hello
 - g++ the compiler program.
 - -std=c++11 we want to use the C++11 standard of C++.
 - hello.cpp the file we want to compile.
 - -o hello the name of the executable to create.

Debugging

What if your code is wrong?

- Same as Python.
 - Syntax errors.
 - Runtime errors.
 - Logic errors.

```
int main()
{
    cout << "Hi" << endl;</pre>
    for( int i=0; i>10; j+=1 )
        cut << "Hello World!" << endl
    return 0;
}
```
