So far you have used Python.

Recap

So far you have used Python. Now going to learn C++.

Created somewhere in 1979-1983.

- Created somewhere in 1979-1983.
- Based on C (created 1972).

- Created somewhere in 1979-1983.
- Based on C (created 1972).
- Going to be learning C++11 (approved 2011).

Languages C++ Variables

Synta Conditi Arrays Loops while for Compil Debugg

- Created somewhere in 1979-1983.
- Based on C (created 1972).
- Going to be learning C++11 (approved 2011).
- C++14 has been approved (2014).
 - No support yet.
- 99.9% backwards compatible.
 - All the way to C.
- Supports the same paradigms as Python.
 - Objected oriented, functional, declarative etc.

- C++

- In future weeks we will be looking at generic programming concepts.
 - Sorting. Searching.
 - Data structures.
 - Those weeks will be taught in Python and C++.

All students are expected to learn some C++.

- Everyone else will have some mandatory C++ tasks.
- BIT students can choose Python or C++ most tasks.
- Will be specified at the time.
- BIT will not be examined on C++ code.
 - May be examined on language differences.
 - High/low languages.
 - Compiling.
 - Static/dynamic typing.
 - Stack/heap memory.

C++

Syntax Condition Arrays Loops while for Compilin

Reca

Most significant difference...

- C++ is statically typed.
 - Python is dynamically typed.
- In Python variables keep track of values AND type.

```
var = 42  # type(var) = <type 'int'>
var = 'foo'  # <type 'str'>
var = 0.123  # <type 'float'>
```

- In C++ variables have one type forever.
 - Have to specify type when creating.

```
int var1 = 42;
string var2 = "foo";
float var3 = 0.123;
```

Languag C++

Syntax
Conditional
Arrays
Loops
while
for
Compiling

In C++ have to specify a variable's type.

- So what types are available?
- Thousands (at least).
 - You can create your own.
- Few standard ones.
- Most basic data types are called primitive types.

- Knowing what the different variables are.
- Knowing all the primitives and the variations.
- Knowing ranges/sizes.

Type	Bytes	Values
bool	1	true/false
char	1	'a', 'Z', '6', '+'
int	4	-2147483647 <i>→</i> 2147483647
unsigned int	4	o → 4294967295
float	4	1.234, -0.0001
double	8	1.23456789, -0.000000001
void		

Sizes are correct for a 32bit machine.

Variable

Syntax
Condition
Arrays
Loops
while
for
Compiling
Debugging

Moving from Python to C++.

- Not as bad/scary as it seems.
- Same basic structure.
- Slightly different syntax.

-Variables

for

Compiling Debuggin

Recap

Python.

print('Hello World!')

Variables

Syntax

Conditional: Arrays Loops while for

Recap

Python.

```
print('Hello World!')
```

```
import sys

def main():
    print('Hello World!')

if __name___ == '__main__':
    sys.exit(main())
```

Python.

```
print('Hello World!')
```

```
import sys

def main():
    print('Hello World!')

if __name___ == '__main___':
    sys.exit(main())
```

C++.

```
#include <iostream>
using namespace std;

int main()
{
   cout << "Hello World!" << endl;
   return 0;
}</pre>
```

Syntax Conditions Arrays Loops while for Compiling

Python.

```
print('Hello World!')
```

```
import sys

def main():
    print('Hello World!')

if __name___ == '__main__':
    sys.exit(main())
```

```
C++.
```

```
#include <iostream>
using namespace std;

int main()
{
    cout << "Hello World!" << endl;
    return 0;
}</pre>
```

- All programs in C++ **MUST** have exactly one main() function.
- C++ uses { and } instead of indentation.
 - You should still have indentation in C++ but is aesthetic only.
- Semi-colons at the end of lines.

C++ Variable

Syntax Conditiona Arrays

while for

Compiling Debugging Same rules as Python.

- Slightly different syntax.
- and is now &&.
- or is now ||.
- == is still ==.

Languages

C++ Variable:

Conditio Arrays

while for

Debugging

Same rules as Python.

- Slightly different syntax.
- and is now &&.
- or is now ||.
- == is still ==.

```
a = 1
b = 2

if a == b and b > 0:
    print('Hello World )
```

Same rules as Python.

- Slightly different syntax.
- and is now &&.
- or is now ||.
- == is still ==.

```
a = 1
b = 2
if a == b and b > 0:
    print('Hello World )
```

```
int a = 1;
int b = 2;
if( a == b \&\& b > 0)
    cout << "Hello World!" << endl;</pre>
```

Similar to Python lists.

Can't be resized.

```
sequence = [1, 2, 42, 69, 8]
sum = 0

for i in range(len(sequence)):
    sum += sequence[i]
```

```
int sequence[5] = {1, 2, 42, 69, 8};
int sum = 0;

for( int i=0; i<5; i+=1 )
{
    sum += sequence[i];
}</pre>
```

Three ways to create a C array.

Just supply size

```
int arrayOfInt[3];
char arrayOfChars[5];
float arrayOfFloats[2];
```

Supply size and initialisation list

```
int arrayOfInt[3] = { 42, 69, 12 };
char arrayOfChars[5] = { 'A', 'z', '9' };
float arrayOfFloats[2] = { 1.23, 0.001, 8.1 };
```

3 Just initialisation list (will figure out the size)

```
int arrayOfInt[] = { 42, 69, 12 };
char arrayOfChars[] = { 'A', 'z', '9' };
float arrayOfFloats[] = { 1.23, 0.001, 8.1 };
```

So far looked at the old style arrays.

- Carried forward from C.
- Still used today.
- C++o3 introduced an alternative.
 - STL arrays.

Carried forward from C. Still used today.

■ C++o3 introduced an alternative.

So far looked at the old style arrays.

STL arrays.

```
#include <array>
using namespace std;
int main()
{
    int oldArray[5] = \{1,2,3,4,5\};
    array < int, 5 > newArray = \{1, 2, 3, 4, 5\};
    cout << oldArray[0] << " " << newArray[0] << endl;</pre>
    return 0;
```

Two types of arrays.

- Old style arrays are still very common.
 - Legacy.
 - Want you to start off using the new ones.
- What was wrong with the old ones?
- New arrays are safer.
 - Avoid overflows.
- Easier to use.
 - Sorting, searching, reversing, iterating etc.
- Are backwards compatible with old code.

C++
Variables
Syntax
Conditionals
Arrays
Loops
while
for
Compiling

Problem, C++ arrays have a set size.

Saw we had to provide a size when declaring arrays.

C++
Variables
Syntax
Conditionals
Arrays
Loops
while
for
Compiling

Problem, C++ arrays have a set size.

Saw we had to provide a size when declaring arrays.

C++ does have 'arrays' that can be resized.

- Called vectors.
- Uses arrays inside.

Problem, C++ arrays have a set size.

Saw we had to provide a size when declaring arrays.

C++ does have 'arrays' that can be resized.

- Called vectors.
- Uses arrays inside.

```
#include <array>
#include <vector>
#include <iostream>
using namespace std;
int main()
    array < int, 5 > myArray = \{1, 2, 3, 4, 5\};
    vector < int > myVector = \{1, 2, 3, 4\};
    myVector.push_back(5);
    cout << myArray[0] << endl;</pre>
    cout << myVector[0] << endl;</pre>
```

C++ vectors are the closest thing to Python lists.

- If you are moving to C++ from Python easier to use vectors?
- append() → push_back() and emplace_back()
- $\textcolor{red}{\blacksquare} \hspace{0.1cm} \mathsf{pop()} \rightarrow \mathsf{pop_back()}$
- \blacksquare slicing \rightarrow resize()

Same rules as Python.

- Slightly different syntax.
- Brackets ().
- Braces {}.
- Semicolons :.

```
counter = 0
while counter < 10:
    print('Hello World!')
    counter += 1
```

```
int counter = 0;
while (counter < 10)
    cout << "Hello World!" << endl;</pre>
    counter += 1;
```

C++
Variables
Syntax
Conditiona
Arrays
Loops
while
for

C++ has two kinds of for loops.

- One type similar to Python for loops.
 - Actually a range-based loop.
 - Will be covered later.
- One type similar to a while loop.

The original C++ for loop.

```
for( int counter=0; counter<10; counter+=1 )</pre>
{
     cout << "Hello World!" << endl;</pre>
```

The original C++ for loop.

> Seems very different to the python loop.

```
for counter in range(10):
    print('Hello World!')
```

```
for( int counter=0; counter<10; counter+=1 )</pre>
    cout << "Hello World!" << endl;</pre>
```

The original C++ for loop.

- Seems very different to the python loop.
- Lots of commonalities.

```
for counter in range(10):
    print('Hello World!')

for counter in range(0,10,1):
    print('Hello World!')

for( int counter=0; counter<10; counter+=1 )
{
    cout << "Hello World!" << endl;
}</pre>
```

- Seems very different to the python loop.
- Lots of commonalities.
- Also to while loops.

```
for counter in range(10):
    print('Hello World!')
for counter in range (0,10,1):
    print('Hello World!')
for( int counter=0; counter<10; counter+=1 )</pre>
    cout << "Hello World!" << endl;</pre>
int counter = 0;
while( counter < 10 )</pre>
₹
    cout << "Hello World!" << endl;</pre>
    counter += 1;
```

The new C++11 ranged for loop, for iterating over a sequence.

- Less powerful that the old style.
- Easier.
- while > for > ranged for

```
sequence = [1,2,3,4,5]
for i in sequence:
    print( i )
```

```
int main()
    array<int,5> sequence =
        \{1, 2, 3, 4, 5\};
    for( int i : sequence )
        cout << i << endl;</pre>
    return 0;
```

Languages

C++ Variable

Syntax Conditiona Arrays Loops while for

Debuggii

C++ code has to be compiled before it is run.

- So does Python it just happens automatically.
- Compiler converts C++ code into machine code.
- Many IDEs handle compiling for you.
 - Visual Studio, Eclipse etc.
