# Dynamic memory

Allocation Deallocation

Recap

- Don't care where in the memory.
- Just care that we can use the variables.
- Pointers store memory locations.
  - Find where variables are stored.
  - Move through memory.
- In Python almost everything is a pointer.
  - So we don't notice.
- In C++ pointers are explicitly stated.

### Dynamic memory

Allocation Deallocation

Recap

# Variables & Memory

Variables are stored in memory (RAM).

Address	Value
1242	'Q'

- OS picks an unused memory location e.g. 1242
  - This location must have enough space to store the variable.
  - Different variable types have different sizes.
  - I.e. sizeof(int) == 4 bytes, sizeof(double) == 8 bytes.
  - But depends on OS, compiler, 32 or 64 bit etc.
- myVariable is our name for memory location 1242.
- In Python can get memory location info using id(myVariable) function.

Recap

# Arrays and Memory

- Variables are stored in memory.
- Arrays are groups of variables called elements.
- Array elements stored sequentially in contiguous blocks of memory.
  - Large objects, i.e. arrays, class instances, floats may span multiple blocks.
  - Demonstrating using old C-style arrays.

Address	Value
4213	'H'
4214	'e'
4215	'1'
4216	'1'
4217	'0'
4218	'\0'

# Dynamic memory

Deallocation

Recap

- Variables are blocks of memory that hold data.
- Pointers are variables that hold memory addresses.
- Each type of variable has an associated pointer type.
- We declare a pointer using an \* after the type name.

```
typename * variableName;
int * i;
char * c;
float * f;
```

Pointers "point to" other variables.

### Why do we care?

Python/C++ differences

# Dynamic memory

Deallocation

Recap

# **Coventry**University

# Why use pointers/references?

### Advantages.

- Pointers/references are small.
  - Instead of copying big data structures around just copy the pointer.
  - E.g. an array storing a picture == millions of bytes.
  - Pointer/reference to an array storing a picture == 4-8 bytes.
- Pointers are required for dynamic memory allocation (C++).

### Disadvantages.

- Pointers are dangerous.
  - Buggy pointer code can crash your program/computer.

Pointer/reference differences

### Why do we care?

Python/C+-

### Dynamic memory

Allocation

Deallocatior

- Can't always know how much memory program will need at compile time.
  - E.g. a program that reads in a file, memory required depends on size of the file.
- Have to allocate it at run time.
  - Dynamic memory allocation.
- Code gives itself more memory, has to remember to give it back when it's finished
  - Deallocation.

Deallocation

Recap

# Dynamic memory deallocation

- You **MUST** remember to deallocate your memory.
- Failure to do so causes a memory leak.
  - Memory gradually gets 'lost'.
- No exceptions.
- NO EXCEPTIONS!

```
int* myVariable = new int;
int* myArray = new int[1000];

// do stuff
delete myVariable;
delete [] myArray;
```

Dynamic memory

Deallocation

Recap

# Garbage collection

- Python does memory allocation and deallocation for you automatically.
  - Automatically allocates memory as you create variables.
  - Automatically deallocates memory that isn't in use.
  - Garbage collection.
- Can still manually deallocate Python objects.

```
variable = 42

// do stuff
del(variable)
```

Recap

# C++ Garbage collection

C++ does not have automatic garbage collection.

- C++11 comes close.
- New features shared\_ptr and unique\_ptr, weak\_ptr.
- Special new smart pointers.
  - Automatically deallocate memory when nothing pointing at it.
  - Don't need to remember to delete.
  - No memory leaks!
- shared\_ptr is 99.9% the same as 'normal' pointers.
  - unique\_ptr and weak\_ptr have extra features.

### Why do we care?

Python/C++
differences

### Dynamic memory

Deallocation

- Variables stored in memory.
- Different variables need different amounts of memory.
- Array elements stored in contiguous sequential blocks of memory.
- Pointers/references store memory addresses.
- Pointers are dangerous but necessary.
- If, at compile time, we don't know how much memory our program will need use dynamic memory allocation.
- Always deallocate memory before the program exits.
