1 Stack and Heap

2 Recap

Stack and Heap

- Memory model used so far is a simplification.
- Actually two places in memory that variables can go.
 - The stack and the heap.
- Both are just regions of the same physical memory.
 - Are managed differently.

David Croft

Stack and Heap

Recap

The stack

- When program is run, block of memory is allocated.
 - Called the stack.
- Each program has it's own stack.
 - Each instance.
- As variables created and functions called they are put on the stack.
- When variables are destroyed/functions complete they are removed from the stack.
- Has limited size.
 - Recursive functions can fill the stack if not careful.

```
Stack &
Heap
```

David Croft

Stack and Heap

Recan

```
int add( int a, int b)
                                        int main()
                                        int var1
         int result = a+b;
                                        int var2
\Rightarrow
         return result;
                                        int add()
\Rightarrow
                                        int a
                                        int b
                                        int result
     int sub( int a, int b )
         int result = a-b;
\Rightarrow
         return result;
\Rightarrow
     int main()
         int var1 = 42;
\Rightarrow
         int var2 = 1;
\Rightarrow
         add(a,b);
\Rightarrow
                                            Stack
                                                            Heap
\Rightarrow
         sub(a,b);
\Rightarrow
         return 0;
```

- Shared memory between all running programs.
- Very big in comparison to the stack.
- Dangerous, must remember to deallocate our memory.
 - Memory leaks.

Stack & Heap

Stack and Heap

Recap

```
int main()
                                          int main()
                                          int variable
         int variable = 42;
                                          int *pointer1
\Rightarrow
                                                                \rightarrow
\Rightarrow
        int *pointer1;
                                          int *pointer2
        pointer1 = new int[6];
\Rightarrow
         int *pointer2;
\Rightarrow
        pointer2 = new int[3];
\Rightarrow
        delete [] pointer1;
\Rightarrow
        return 0;
\Rightarrow
                                                Stack
                                                                      Heap
```
